

Specific Gravity Bench

The SG-20 specific gravity bench is used for easy suspended weighing of samples in water for relative density determinations. The sample determinations are of aggregates, hardened concrete, bituminous mixtures, refractory brick and similar materials. The construction of the bench is sturdy, heavy gauge painted steel and features three 2in diameter holes. The use of the holes are on the top of the balance platform for weigh-below hook suspension of samples and thermometers. On the lower half of the bench is a support shelf that is adjusted to fit 30 gallon or 45 gallon water tanks.

Features:

- Optimal for weighing suspended samples in water for specific gravity determinations
- Convenient holes for weigh-below suspension
- Lower support serves as a shelf for water tanks
