

De-Airing Water System & Tank

De-Airing Water System

De-Airing Water Systems produce 8-liter batches of de-aired water without the use of heat. The device combines with mechanical agitation and vacuum evacuation to remove gasses at a much higher rate than conventional heat-boiling methods. Water gets de-aired to less than 0.5 pph dissolved oxygen in 4 minutes. The system requires a vacuum pump, 1/55hp motor 110V, 60Hz that is sold separately.
